

Evolution and Religion... or religion and religion?

Big Bang

The Big Bang theory is the evolutionary explanation of the beginning of the world. But, it does not explain the giant problem of all the natural laws and explosive elements necessary everything to happen. What most people do not know is that the geological time-table **actually suggests a sudden**, massive explosion of life on earth...starting at about 300-500 million years ago.

Is it possible that the Big Bang theory is true...but not quite like we have heard. This real Big Bang would explain the beginning of the world...and the explosive elements necessary. It is called **creation**. Just a thought!

Since there is no direct scientific evidence that tells us one way or the other, wouldn't it make sense to base our decision a decision on what the scientific evidence suggest.

What does the obvious design, purpose and variety of our world suggest?

What does a study of non-living things that have no reason to chance suggest?

What does the correlation of the heart, blood and blood vessels suggest?

What does the development of emotions and intelligence suggest?

What does color and diversity suggest?

What does the relationship with dinosaurs and humans suggest?

What does the remarkable birth of a baby suggest?

What does the lack of one missing link suggest?

Since it takes **faith** to believe in either creation and evolution, is it possible we are investigating **religion** and religion instead of **evolution** and religion?
