

Evolution and Religion... or religion and religion?

Dependance on Oxygen

As we honestly consider the probabilities of random evolutionary change, add one more mystery to the equation. How did all the animals developed **independently**, but end up with the **same** explosive element necessary for life...**oxygen**?

This is especially interesting because according to evolutionists there could not have been any **free oxygen** in the beginning. If this is true, new life would be different from anything we know, and it would be reasonable to assume first life had to survive on something other than oxygen. When did the new life forms make **the switch** to oxygen? How many new life forms were burned to ashes before the process was completed?

Now, we are faced with another interesting happening. We are not just talking about the necessity for oxygen. The whale gets its oxygen from the air and the shark gets its oxygen from water, but neither can live long outside of water. How did they both evolve in the same environment, depend on the same element, but end up with such striking **differences**? How many whales and sharks sacrificed themselves in this grand experiment?

Why would it be necessary to make these unbelievable changes? Even blind chance would have an impossible job making this happen. None of the other animals in the ocean cared about what was happening.

People are the only witnesses to all this remarkable purpose and precision. Is it possible all these **differences** are around so we can get a glimpse of something very much higher than ourselves, something (how dare we say it) spiritual?

It would seem to take **blind faith** to believe all this happened by chance. Since faith is a **spiritual** matter, is it possible this issue is really **religion** and religion...instead of **evolution** and religion?
